Level 4 is the default model for WOA

Maximum Downside Risk To Date 20%

Additional Levels 3 & 5

WOA Performance & Sharp Ratio 3.2

- Definition of 3.2 Sharp ratio is calculated with a mixture of Levels 3-4-5 overall performance.
- Overall pie-chart performance is a compilation of data during 2019 for both live and simulated results for 2019 across Levels 3-4-5

What is WOA?

WOA stands for War of Attrition, a military term we feel best describes how our Ai trading system functions. WOA constantly, through attrition and artificialintelligence, analyses markets in real time. It is programmed to simultaneously look for reasons not to be in the market while seeking certain criteria which overrides and tells us we should be in the market. Our programming, modeling and philosophy is both prudent and conservative. We seek, first and foremost, the preservation of capital while constantly seeking to capitalize on those special situations which will result in worthwhile returns.

WOA is the next advancement in the world of trading. It is an asymmetrical risk/reward managementprocess that provides for a significant profit potential.

WOA War of Attrition (WOA) was developed and is managed by the developer of WOA, Donald Beaudry. This highly sophisticated Ai trading system is the next 'alpha generator' of trading in the markets.

WOA daily reviews thousands of potential trade set ups and analyzes the possible trades to determine their viability through ML, machine learning. Determining the viability of WOA's trades is done in real time using an electronic check off list to see if a trade qualifies for execution at that exact moment. Flash technology is used to analyze a stringent and rigorous proprietary check list developed exclusively by the developer of WOA, Donald Beaudry. If a potential trade doesn't meet our exacting grey box model systems metric, a position is not entered into by WOA. WOA is a fully automated system which requires no human involvement.

It should be noted, when a trade is entered into, a precise stop-loss level is pre-determined. This stop-loss calculation uses a purely mathematical paradigm. If breached the trade is exited. The end result is an extremely accurate trading system featuring consistent year to year positive returns with exceptional risk management techniques incorporated into and driving results.

WOA, using flash technology, is constantly analysing when, and if, it is time to be entering into a short or long position. When all our criteria is met, then and only then, is a position taken. WOA takes in real time data and analyses it in microseconds to determine if a position should be taken or not. The end result is overall extremely accurate trading with minimal down side risk.
